

HULFT Managed Integration Services

Outsource your data integration complexities. Achieve fast ROI. Satisfy the requirements of both your IT and business teams.

A recent report on data management by Vanson Bourne found that 40% of technology leaders believe that the IT department is spending too much time on managing data infrastructure, and 70% believe they will need to cut their IT budget over the next year. At the same time, business teams want access to more data than ever before to remain competitive – from legacy and modern sources, with an exploding number of formats.

The HULFT Managed Integration Service efficiently solves all of these concerns, providing instant connectivity between employees and the data sources they need to be more productive.

In many cases, Saison Technology customers do not have the staff or the budget to manage all their integration projects. Still, they have urgent needs such as improving a business process or boosting topline revenue. For a flat monthly fee, we will design, deploy, and manage your data integration needs on a single modern platform with complete enterprise security.

HULFT Managed Integration Services can handle everything you need to solve even the most complex integration challenges without sacrificing ease of use, speed or agility.

Key Benefits of HMIS

Total customer control and visibility. Even though HMIS is outsourced, we provide full visibility via the Global Administrator Console that is used by business and IT professionals.

A foundation to reduce complexity and spur innovation. Saison Technology provides a path to solve your integration needs today, and we provide the infrastructure that integrates seamlessly with other enterprise systems. No matter what data source and no matter how old it is, our framework makes future projects more doable and more efficient.

Simple and predictable billing. We provide complete transparency with mutually agreed-upon monthly price and initial setup fees.

GDPR, CCPA and SOC 2 compliant. Our data models enable your organization to expand deployments globally with confidence, knowing that machine data and customer information are protected in any country.

Count on HULFT to Connect Anything – SaaS, On-Premise or Legacy

Our typical customer has data located in the most modern SaaS applications and databases that are over 10 years old. Saison Technology provides connections to a wide variety of data stores and data providers whether local, on premises, or in the cloud. Data sources range from text files to Excel spreadsheets, databases, message queues, email servers, FTP servers, web services, cloud stores, applications and big data lakes.

A Trusted Team

With more than three decades of helping global companies solve the most complex data integration challenges, the HULFT Professional Services team leverages its best practices through engagements with line-of-business professionals and technical staff. We locate key data sources and transform them into a format that can be consumed by the applications you need.

A Globally Proven Enterprise Platform and Managed Services for Ultimate Flexibility

For more than three decades and across over 10,000 customer deployments, Saison Technology operates one of the most proven enterprise data integration platforms in the world. We were among the first middleware and MFT providers, and have since led our customers through each evolution of data integration.

In addition to on-premise, private- and public cloud deployments, Saison Technology now offers managed services hosted in AWS for customers who do not have the budget or the internal expertise to manage integration projects. Let us provide an option that is right for you.

HULFT Cloud Solutions are Hosted in AWS

Cloud Platform Features

The business user's experience of any offering on the HULFT Integration Platform is seamless. They don't 'see' the technology but will quickly appreciate having more access to data than ever before, which results in higher productivity and the ability to make informed decisions faster.

Data Mapping

A powerful and flexible graphical data mapping component for mapping between input and output structures. It handles tabular and hierarchical formats and also allows mapping between similar and dissimilar formats.

Merge Mapping

It combines two or more input data sets into a single output data set. Create appending data sets, merging and joining data sets using a simple drag-and-drop graphical interface.

Automated Parallel Processing

Our automated parallel processing feature is designed for efficiency. The HULFT execution engine automatically leverages parallel processing within specific components, ensuring minimal memory consumption. This means you can process large data sets without worrying about system memory, making your data operations smoother and more efficient.

Graphical Debugger

This feature enables project-level execution debugging by viewing real-time execution in a flow and set breakpoints within a flow to monitor the environment.

What makes this possible is Saison Technology's powerful data integration architecture. IT leaders appreciate the breadth and depth of our technology that has evolved for three decades as a mission-critical integration platform to serve more than 10,000 customers worldwide. Below are a selection of HULFT's capabilities.

Built-In Versioning

When configured with a repository database, the HULFT Integration Platform provides automatic built-in versioning of projects. This makes it simple for developers to revert to prior versions of projects if necessary, and it greatly simplifies overall code management.

Documentation Generator

An entire set of project documentation can be generated in HTML format. The documentation specifies each script (flow) within a project, all components, and their configurations, and details on all data mapping and merge mapping operations.

Enterprise-Grade Security

Saison Technology provides a built-in user and group security framework. For enhanced access management, projects can be configured per user or group by what they can read, write, and register.

Deep Observability

The HULFT platform is built on industry standards and the service traces data movements from the code statement level to the machine it runs in. It presents all observability data and logs aligned in the same dashboard timeline, and we'll trigger anomaly alerts for your IT team and call your attention only when required.

More Than 10,000 Customers in 40+ Countries Trust Saison Technology
