

HULFT Transfer

Move the Information That Matters

HULFT Transfer is one of the most trusted and widely adopted next-generation managed file transfer solutions on the market today. Thousands of enterprises use the solution to quickly, securely, and reliably move large volumes of high-frequency information.

For the last 20 years, enterprises have used HULFT Transfer as the foundation of their business infrastructure. Built around a robust framework of character code conversions, multi-OS environment support and cross-platform integrations, HULFT Transfer ensures critical information always gets where it needs to, intact and on time.

Why HULFT Transfer?

HULFT Transfer provides fast file transfers – up to six times as fast as legacy FTP solutions. Our compression technology offers stability (without any special tuning), large data capacity, and inter-cloud service transfers.

There should never be any question of how secure your data is during the transmission process. Saison Technology incorporates the highest levels of encryption technology and modern authentication methods to safeguard your mission-critical data. Our user-friendly interface makes it easy to configure, automate, track all your inbound and outbound data transfers, and meet the most stringent compliance standards.

HULFT Transfer is not just easy to configure and modify, but its central management capabilities empower you to manage your entire network of data transfer from one single location. We've also made it straightforward for you to design and automate your business processes, further reducing IT and maintenance costs.

Key Benefits of HULFT Transfer

Move your data securely and reliably.

We've built in redundancy and restart capabilities so your information arrives completely intact.

Achieve operational efficiency.

With HULFT Transfer, you can do more with less. With just an internet connection, the solution's full capabilities can be leveraged – no special equipment is required.

Optimizes the power of the cloud.

HULFT Transfer supports both private and public cloud; and integrates with all the major cloud services, and more.

Meet compliance standards.

Saison Technology solutions provide visibility into every aspect of your data transfer process so you can track SOX, HIPAA, and more.

Solution Features

Moving data is only one part of your organization's data architecture. Data teams are working around the clock to discover, sort, collect, and secure transfer information, often coding scripts to integrate complex systems.

HULFT Transfer fits into Saison Technology's comprehensive data integration platform, which includes HULFT Square, HULFT Integrate and HULFT Managed Integration Services.

With over 10,000 customers spanning finance, supply chain and manufacturing sectors across 40+ countries, Saison Technology is one of the most trusted and widely adopted data logistics solutions on the market today.

Failure Recovery and Detection

When you're facing missing or corrupt data in the file transfer process, you're at risk for losing critical data that can cost your business. With enhanced search capabilities, HULFT Transfer offers rapid flaw detection, helping you to pinpoint the cause of error and reduce your recovery time.

Script Execution Hooks

These provide users with extreme flexibility and control over their file transfers. Users can execute scripts before and after a transfer job; on the send or receive side (or both); and allows for different configurations based on whether transfers are successful or not. User-configured tasks can be selected and adjusted, such as zipping an entire directory prior to transfer, notification via SMS text that a transfer failed or was successful, and more.

Automated Configurations

Flexibility is at the heart of HULFT Transfer and we've created a framework for users to easily automate their file transfers. File triggers provide a mechanism to detect file changes such as a new file creation, deletion or update, which can all be configured to invoke job transfer execution. HULFT Transfer also provides a scheduling mechanism so transfer jobs can be started at a point in time and on a recurring basis.

Enterprise Grade Security

In a mobile, cloud-based world, you're faced with a new set of data protection challenges. HULFT Transfer offers configurable encryption at the transfer job level, access management, and leading network DLP to help you establish the strongest levels of security and compliance within the network. These include:

- AES256 / HULFT proprietary encryption
- Data loss detection and integrity monitoring
- Prevention of unauthorized access and operation log output

High-Performance Compression Engine

Built-in compression is an optional feature that can be configured as required on each transfer job. Users can choose to utilize compression before transfer, and to decompress on successful delivery. Compression and decompression occurs in-memory so the entire transfer job remains high performing.

Other features that help users be more agile and flexible with their file transfers include:

- Automatic optimization of network transfer configuration
- Configurable inflight data verification via checksum
- Detailed logging and error reporting
